

## Your Hand-held Was Designed to Last 10 Years. But Your Back-End Infrastructure Wasn't.

Your tried-and-true handhelds rolled out years ago, and haven't changed since then. In the meantime, your infrastructure has been updated, tweaked, and patched a dozen times. As new back-end hardware and software comes online, connectivity with your industrial handhelds has become unreliable or even impossible.

Recent updates to common PC and server operating systems have made direct sync connections to handhelds problematic. Next-gen handhelds would be a solution, but the cost would be significant. If only there was a way to connect your legacy handhelds directly to your network.

Portsmith has the solution. Our products have been connecting handhelds directly to ethernet for decades. With over 25,000 units deployed, you can be confident in our solution.
